Both are basic ways to alter the structure of the knee in order to better heal the injured joint. Similar to arthroscopy, this procedure is performed as an outpatient surgery and requires only local anesthesia. This surgical approach is recommended for treating: Grade I to II, complete tears involving the medial meniscus Grade I to III, partial tears involving the medial meniscus Grade IV, tears involving the lateral meniscus Grade V, tears involving both menisci If you've never had knee surgery before, you might feel a bit anxious about it. We at the Bursa Institute in Columbus are here to help with any questions or concerns you have. Our goal is to provide excellent care for the health and wellbeing of all of our patients. Feel free

to contact us to set up an appointment so we can get to know you and your situation. MRO Procedure
The objective of this operation is to change the relationship between the tibia and the femur. As the bone heals, the joint reduces knee pain and may eventually heal completely. Patient positioning
The procedure is performed under local anesthesia. The surgeon will make small incisions in the front of the knee, expose the knee joint through the patellar tendon and perform a MRO. Deeper cuts will be made along the medial joint line through the tibia and the fibular bone. The exposed bone is lowered and reinserted with K-wires. The K-wires may be removed one week after 1cb139a0ed
