There has not been a failure of an engine since the inception of the program. A conservative change to the operational limitations for the program was made after the Duke 3-22 test, and no failure has occurred since. The program is currently running well, but if an engine failure does occur, that failure is not expected to come from unexpected sources. Testing and design The development of the LS-series engine used the same methodology as the HL-series engine. It was first to be designed, and with all functional tests completed first, there was more time to work on design issues such as supercharger setup and block design. Engine design begins with a flowchart. A flowchart is an initial step in which the design is broken down into its separate elements, and each element is assigned its own function. Next, a new functional block diagram is designed that sets out the purpose of each component, as well as any components that might be needed to support it. As for the main function of the engine, the maximum expansion ratio has been chosen as the factor that defines the ultimate performance of the engine, as well as its driveability and handling, since high expansion ratios make for higher compression ratios. Since more power is required to move larger masses at high speeds, the crank length was chosen as the next factor in the design, as it is a fundamental element of how much power the engine will develop. The block is then designed to suit the crank length, while keeping the width of the block at a minimum for

Voice Control doesn't seem like something that would actually work, but if it could, you might say that it's revolutionary. At the Computex show in Taipei, Taiwanese company Sagaro has demonstrated just how real the idea of voice control could be. It's not something that will set the world on fire, but it is an intriguing concept that looks like it might actually be used in the future. Voice Control is a technology that was pioneered by LG back in 2006 and it makes use of a Voice Activated Headset (VAH) and a server. When you want to use your smartphone's features, you should say the command you want into the VAH and the server will actually understand your words. With the level of technology that is being used to make this technology work, it can easily be adapted to numerous different functions and devices, including TVs, stereos, computers, appliances and even personal health products. Even with everything that has been built on top of the original technology, this doesn't look like a technology that is going to go away any time soon. But is it something that we will actually see in stores or on our desktops? Voice Control Video: More Related Videos: Samsung Galaxy Note 4 Samsung Galaxy S4 vs iPhone 5
