How to Convert a Folder of Audio Files in One Shot The first and the most important settings are: · Target Audio Format · Source Audio File Format · Directory of Converting Files After you have selected the settings and have made some other changes, you should save them at the end, to make sure that when you launch the application, the settings will be the same as you have them just now. Now you may wonder how the application checks how many files you have selected. The answer to this is that it automatically knows how many files you have selected in a directory, by adding a counter in the code. You can see the example below. We will consider that you have selected 1,000 files, then if you go to folder with 100 files and you go to folder with 1,000 files, your 2,000 files will be processed by your selected settings. Now, let's see what the other options are: · Save the Output Files When the Process is Completed · Save the Output Files in an Output Directory · Number of Files to Process · Media Duration · Length of Media Files · Filename of the Output File · Output Audio Format · Stop On Error · Removes Empty Files A lots of other options are enabled or disabled automatically based on the settings you have chosen.
