FPMz-Fast Fourier Transform-z is an innovative application which implements FFT and POW methods for calculation of FFT. It can be used for monitoring CPU load. This handy utility calculates real-time CPU load and CPU temperature. The main features of this program: Fast calculation speed of FFT and POW; Low CPU usage; Graphical display of CPU load and temperature; Self-consistent calculation results. Elapsed time during the benchmark (real time) Score Notes User rating Elapsed time is not accurate, depends on user's computer. But it's pretty good for benching purpose. And there are so many features but sadly it seems they removed some from version 3. Now I'm going to look for a program that works like this before purchasing FFT-z. Rating: 5 Posted: 09-25-2007 Review: This is the best CPU test for benchmarking. However, I found that this package doesn't work well with Windows 7 Ultimate 64 bit and Windows 7 Enterprise 64 bit. It might be because it might be an out-of-date program. I'm looking for another package now. Rating: 3 Posted: 09-25-2007 Review: This program is an excellent program for benchmarking your CPU. It can be used for benching and for monitoring system performance. The only problem is that some features are no longer supported, such as view the frequency of a processor.Some questions concerning the spontaneous cells of the adult eel. Isolated spontaneous cells of eels from the Danube are described in comparison with freshly isolated normal cells. Spontaneous cells are smaller and more polygonal in shape and have more cytoplasm, less vacuoles, and more pinocytotic vesicles than the fresh cells. A conspicuous localization of the cytoplasm in the cell-bodies of spontaneous cells may be an indication of structural alterations. No significant difference could be detected in the basic membrane constituents.x.
