Expressed-in-B-cells-specific (EBER) RNA is expressed in normal plasmacytoid and

plasma cells, in most cases, where it is associated with latently or actively proliferating plasma cells. EBER-1 and EBER-2 are splice variants of EBER RNA, but the relevance of these variants in hematological malignancies is not known. The expression of EBERs has been observed in numerous non-Hodgkin lymphomas. However, no information is available regarding EBER expression in multiple myeloma (MM). We investigated the expression of EBER-1, EBER-2, and EBER-3 in a series of 61 patients with MM. Reverse transcription-polymerase chain reaction was performed to detect the expression of EBER-1, EBER-2, and EBER-3 in the plasma cells of MM. The EBER-1 and EBER-3 expression was detected in 56 of 61 (92.8%) and 58 of 61 (95.1%) patients, respectively, whereas the expression of EBER-2 was detected in only 21 of 61 (34.4%) patients. The results of EBER expression were comparable in newly diagnosed and rel 5b5f913d15
