Photoshop is easy to use, but it is an intimidating tool for those unfamiliar with it and does make more experienced users' eyes glaze over a bit. You may want to check out the upcoming sections on Dreamweaver, which is a web-design application, and Creative Suite, which includes another program called Illustrator. Adobe's suite also includes InDesign, a program that's used for desktop publishing. You can access all of these programs via a single login. Or you can work with individual programs, such as Photoshop, to create or manipulate images and then export them. Basic and intermediate tools Photoshop includes three main panels for doing image and graphic editing and manipulation: Curves tool (shapes) Select tool (selecting the object or path) Free transform (rotating, scaling, and moving the object) As shown in Figure 16-1, these three main panels offer most of Photoshop's editing and manipulation capabilities. **Figure 16-1:** The Curves and select tools are used to manipulate image properties, such as brightness, contrast, and saturation. Photoshop includes a range of tools for editing and manipulating images. You can use them to modify the brightness, contrast, and other color and texture attributes in a photo. You also use these tools to merge layers to create complex effects, paint in and out areas, repair objects, and perform other edits. As you use each of the panel buttons in Photoshop, the panels shift to the right and the buttons become more prominent in the palette, as shown in Figure 16-2. **Figure 16-2:** When you're ready to manipulate an image, you can access the image editing tools immediately. Figure 16-2 also shows the tools that are available when you use the little drop-down arrow in the upper-right corner of a tool (see the following list for a quick overview). The same drop-down menu also contains the tools that are available when you press the Opt key on the keyboard. Both sets of tools are identical. If you're new to Photoshop, you may want to run through the tutorial at the end of this chapter, which walks you through the basics of using a few of these tools. And the following list is a quick overview of all of the tools you'll use in Photoshop: Brush: You use the Brush tool to select an area and paint with it. You can paint around

What is Photoshop Elements? What does it do? A friend of mine, who is a graphic designer, told me that my mom should consider buying Photoshop Elements instead of Photoshop. She asked me to explain what Photoshop Elements is. Photoshop Elements is an image editing and retouching app with a simple interface. There are less options in Photoshop Elements than in Photoshop. It is much easier and safer for beginners to use than Photoshop. Photoshop Elements is focused on creating quality images. It has no video editing features. You can use Photoshop Elements to create templates for websites. It is a good option if you want to create logos, banners, business cards or other graphical designs for a website. You can use Photoshop Elements to retouch photos or create digital art. You can use it to make shapes, text and remove

unwanted parts of photos or to create new shapes. Aperture and Adobe Bridge are built into Photoshop Elements, so you can sync photos and videos between your phone, tablet or computer easily. You can use Photoshop Elements for DIY projects. It's a good option if you want to scan drawings, do DIY projects on your computer or if you want to retouch photos you already have. My mom eventually bought a copy of Photoshop Elements instead of Photoshop. She asked me for my advice on this decision. Can I use Photoshop Elements to create or edit videos? Photoshop Elements can help you create cool videos but it can't edit and retouch videos like Photoshop. What does Photoshop Elements offer? Photoshop Elements offers a lot of different features, but one of the most important features is that it is easy to use. Here are the most important features of Photoshop Elements. It's easy to edit and retouch photos You can do 90% of the same work that you can do with Photoshop. You can crop, align images, crop graphics, change colors, blur and sharpen the photos and erase unwanted parts of the photos. You can also apply effects, apply a vignette to your photos, make drawings, and edit text. You don't need to have design skills to make designs for websites or to make logos. It's easy to edit and make graphics You can easily create new images, rectangles, lines, shapes, merge images, erase or add a bevel to images, move and resize graphics, add shadows and apply gradient fills 05a79cecff

The Weekly Blog All the Week's Politics at Once! It's all there this week. First, and don't worry, this isn't a promo for The Weekly Blog. While we try to keep politics out of the news, it inevitably shows up in some form in the news. And with this week's conclave of the Democrats in Vegas, it's especially at hand. But that's not what I'd like to talk about. I'd like to talk about the Republican Primary. And that's not going to be easy, I know. The internal power struggle has no end in sight. It is impossible to predict what the next move will be, and everyone's watching. Now, Newt Gingrich has the most to lose. His campaign was clearly in trouble, and Newt stepped in to resurrect it. His effort is even now being quietly shopped around, which means one of the more discreet, less likely candidates may be going for the prize. Tim Pawlenty is one name that keeps coming up, as has been pointed out here. His efforts are covered at the Flosses' Dawgs Den. But again, that isn't what I want to talk about. I want to talk about a piece I read in The Atlantic on the Republican Party. I have a new-found respect for the Republicans. For me, the primary has been all about the Democrats. The candidates left over from the Bush years. The guys who can't get coverage on the air. The ones we're supposed to forget. And for all the crap we give them for it (myself included), I thought the Republicans had a pretty good shot at winning some major elections. I thought the Senatorial contest was going to be competitive, and I was wrong. Their losses were mostly unsurprising, and that should make the surviving candidates even bolder. But there's a lesson to be learned here. The Democrats gained all sorts of support for their candidates because the Republicans chose such flawed candidates. The Republicans, on the other hand, ran poor candidates against mediocre or more popular Democrats. It worked because they had the most momentum. Just think what the Republican Congress would be like if the Tea Party had an off-year and they ran a high profile candidate. Then what? The potential for the Republicans is endless. Not just in sports. On the downside, right now the Tea Partiers are likely to vote for us. "

What's New In?

Q: Nifi - CSS import issue I am new to using Nifi, I am running a NiFi flow which has basic authentication to a webservice, I am using CSS to pass some additional information from the page to the webservice. I was sending that information via a GET request and that worked ok. However, now I need to add a CSS statement to a CSS file and add it to that flow. I am unsure how I would do this as the examples do not appear to cover this option. For example, this is what I have now: A: If you are using Apache Tomcat as NiFi uses, then here is how you can change the CSS file in tomcat. Create a Process-HTTP-Request property in your UpdateAttribute processor with the attributeName = HTTP_CSS_RENDERED and attributeType = AttributeValue. Then a replaceText processor that accepts the CSS stylesheet that you wish to display in the tomcat manager and change the HTML that you have in it and change the style in it. Make sure to use AttributeValue instead of AttributeValueType.AttributeValue Q: Include only the new data from a timeseries in a dataset I've got a temperature sensor that makes (roughly) 60Hz updates of a one-dimensional array of doubles. These updates are in fact the measurements of each of 60 instances of a specific sensor. Imagine this scenario: in a specific case, the device registers a situation where the sensor was off and hasn't registered a temperature value since the last update, and as a consequence, the sensor hasn't made a temperature update since the last update. In this situation, the sensor makes a lot of updates (probably more than 60) within a short period (maybe a few seconds) of time. How do I include in a dataset all the sensor data that was registered within this short period of time and exclude all the data registered outside this period? A: I came up with the solution I was looking for. I've used a Map, which allows me to not only get all the data from the sensor within a specific time interval, but also to filter it (by key). Then, I combined the filter results (each key representing a value) into a single array of doubles, which can be handed to a dataset. I don't know if this is the best way to do
