Many magazines have free or pay-per-view tutorials that are not always extensive enough to satisfy beginners. You can also purchase DVD or CD-ROMs that have dozens of Photoshop tutorials. Once you gain some experience, you'll be able to find the tutorials that are right for you. Many online tutorials are not created by professional writers and may be unnecessarily difficult for beginners. However, if you're a beginner, you'll find them useful and will often get results before trying to figure out how to "get there." When you're first working with Photoshop, it's best to start with simple tasks such as color replacement, image segmentation, and simple masking. These tasks are essential for creating Web designs, but beginners often struggle with them. These are the jobs that will be the best for beginners—the jobs that will not teach you to create complicated image elements or design a Web site. \*\*Note:\*\* Professional image editors are taught Photoshop in two-week short courses called Photoshop 101, Photoshop 201, and so on. These courses teach you how to use most of Photoshop's features, plus they show you how to work in a production environment. They are often held in large cities with a large population of other digital artists. These two-week courses are generally very expensive and can run well over a thousand dollars. Even working online at home, these two-week courses cost a lot of money. If you attend one of these courses, you can use Adobe's Student Advantage program to apply for a refund of your course fee. Early and Late Adult Size Allometry as Evidenced by Metatarsal 2 and Femur of Pediatric Marmosets (*Callithrix jacchus*) and Adult Common Marmosets (*Callithrix penicillata*). With increasing population densities and resultant increased competition for food resources, it has become important to understand the growth of wild species. In primates, the study of allometry in bone length as a function of body size has revealed several growth patterns as well as ontogenetic trends. This study focuses on the forelimb metatarsals 2 and femora of marmosets (*Callithrix jacchus*) and common marmosets (*Callithrix penicillata*) to understand their growth patterns and peak adult lengths. It was determined that both species showed a mature bone length of ~17.6 cm as adults, and within each species, the proximal end of the femur showed the greatest length (~2.2 cm), whereas the distal end of the metatarsals 2 showed the smallest lengths (~0.6 cm). These data on the bone lengths of juvenile marmosets are compared with the data available in the literature and discussed in the context of implications on their survivorship in the wild. It is concluded that for immature marmosets (up to 2 years) and adults of both species studied here, dispersal is the optimal survival strategy, and adult growth rates are similar to what is found in birds. The findings also suggest that the events contributing to bone length patterns are mostly established by 3.5 years of age for both marmosets. This study, thus, supports the hypothesis that developmental changes that occur in bones of the skeleton of marmosets are similar to those reported in birds.

Study of temporal variation of exposure of hazelnut oil to hazelnut allergens using crude pollen extracts and roasted hazelnut allergens. Exposure to hazelnut allergens in pollen is unknown, which may cause uncertainties in establishing hazelnut-related immunotherapy safety. We assessed the variation in exposure of hazelnut oil to hazelnut allergens using crude and roasted hazelnut allergen extracts and hazelnut oil. Skin prick test was done on eight hazelnut allergic patients with the crude hazelnut allergen extract (HAE). Sensitization to roasted hazelnut allergens was also tested. We analyzed the differences in hazelnut oil between pre- and post-hal

Obstetric care in rural health clinics. This study was conducted to determine the availability of obstetric care in rural health clinics in the State of Colorado and the factors that were associated with access to care. This cross-sectional study, conducted during 1998, reviewed the medical charts of 643 women in rural health clinics in Colorado. Data collected on the women included self-reported living in rural areas before their pregnancies, demographics, travel time to the nearest provider of obstetric care, and reproductive history. Chi-square analysis and logistic regression were used to determine factors associated with access to obstetric care. One-hundred and twenty-nine women had received care at one of these clinics from the time they lived in rural areas before their pregnancies. One hundred and seventy-nine charts were available for review; only 113 (32.2%) charts were considered complete. The characteristics of the women whose charts were complete were similar to those for all the women who were recorded as having received care at one of these rural health clinics. Travel time was the only significant variable associated with the level of care received. We conclude that rural women in Colorado have access to basic obstetric care. Further efforts to increase access to quality obstetric care in rural communities should focus on the reduction of the overall travel time needed to reach an obstetric provider.
