We describe two men with congenital urethral diverticulum. The first presented a history of recurrent febrile urinary tract infections from infancy; the second presented a history of recurrent meningitis at birth. The diagnosis was made in the first by means of voiding cystourethrography; the second, by means of intravenous urography. Treatment consisted of transurethral resection in the first and transurethral enucleation in the second. Recurrent urinary tract infections in patients with congenital urethral diverticulum may be due to bacterial colonization and inflammation of the diverticulum, and the diverticulum should be considered as a cause of some cases of recurrent urinary tract infection.Voltage-gated sodium channels and neurotrophic factors: the keys that unlock brain plasticity. Understanding of neural development must encompass the neurophysiology of injury, including the possible effects of electrical or pharmacological stimuli on the developing brain. Using a combination of genetics, molecular, and electrophysiological methods in the mouse, we have shown that voltage-gated sodium channels (VGSCs) and neurotrophic factors play an important role in the regulation of synaptic and network plasticity in developing and adult brain. These factors act as key regulators, in concert with metabotropic and ionotropic glutamate receptors, of postsynaptic calcium signaling that in turn regulates plasticity by way of several different processes. The focus of this review is to provide an integrated view of the role of VGSCs and neurotrophic factors in mediating plasticity during development and how regulation of their function may be important for the response of mature circuits to injury. 2 = 0 f o r y . - 1 L e t m = 1 9 4 + - 1 9 1 .
