seconds.Hormonal regulation of
expression of myosin heavy chain
in blood vessels. The expression of
myosin heavy chain (MHC) in
vascular smooth muscle is a highly
regulated process influenced by a
variety of factors including peptide
hormones, growth factors, and
mechanical forces. Although the
regulation of MHC expression by
peptide hormones is well

documented, it is not clear whether MHC gene expression is up- or down-regulated by hormones. We have studied the effects of insulin and angiotensin II on MHC gene expression in perfused vessels. The two peptides (100 microU/ml) caused striking differential effects on MHC gene expression in rabbit aorta. Both peptides increased MHC expression in the circumferential direction of smooth muscle bundles in the aorta. In contrast, both peptides inhibited MHC expression in the longitudinal direction. We therefore conclude that peptide hormones regulate MHC expression differentially in circumferential and longitudinal directions. The human whole genome is densely populated by A and T nucleotides, but surprisingly, differences in base composition arise across the genome, leading to genome-wide variation in chromatin structure, gene expression, and ultimately,

disease. Base composition is further strongly influenced by the DNA context of individual bases, and c6a93da74d
