number of articles and
videos. Zuleyka Zevallos Open
The Zuleyka Zevallos Open was
a golf tournament in Mexico on
the Challenge Tour, the official
development tour of the PGA
Tour. It was held from 2001 to

2003 at several locations. The event attracted many low-ranked European players, who compete on the Challenge Tour, with some playing in the same team event as on the European Tour in the European Tour Internationals. The event usually opened with an Invitational section for those who qualify and a separate Open section, and had a few foreign-based players who are good enough to be in the Open section and had won or who were ranked in the top 150 on

the Challenge Tour Order of Merit. It was named after the player Zuleyka Zevallos, who won the Spanish Open in 1985 and 1987. The prize fund was almost always below €50,000, making it a very small-field tournament. Winners External links Coverage on the Challenge Tour's official site Category:Former Challenge Tour events

Lipid disorder of postural and kinetic stability of the eyes in patients with primary open angle glaucoma. Routine electrophysiological

examination of 45 patients with primary open angle glaucoma (POAG) and 60 healthy subjects revealed a decrease in the latency of dark adaptation as well as in the amplitude of the a-wave, b-wave, and oscillatory potentials in glaucoma patients. Both the early and late parts of the electroretinogram (ERG) were abnormal in most of the patients. A disturbed equilibrium of muscular and elastic fibers of the palpebral, bulbar and limbal conjunctiva, ocular blood flow, and the optic

nerve demonstrated lipid metabolic disorder as a primary disorder in patients with POAG. An inverse correlation was found between the amplitude of the a-wave of the ERG and the eye with ptosis of the ocular globe. The amplitude of the a-wave was smaller in eyes with advanced visual field loss. The latency of dark adaptation decreased in eyes with advanced visual field loss. Ptosis of the ocular globe and ocular hypertension did not
